**Research Interests:**

I am interested in investigating the microbial and viral ecological dynamics associated with animal host holobionts, more specifically, in the mucosal surfaces in humans and scleractinian corals. These systems are unique in the sense that they provide a complex niche for bacteriophage that predate on microbial pathogens that antagonize the host. I hope that my research will lead to advancements in therapies that utilize viruses to manipulate conditions favorable for their animal hosts, which will be applied across diverse environments ranging from human clinical settings to large-scale ecosystem treatments for preservation and restoration.

In addition to my research I am involved in teaching and community outreach. I have taught classes and workshops on a variety of topics including marine ecology, metagenomics, molecular biology, and experimental microbial ecology.
